REFLECTION QUESTIONS

1. Did your estimations reflect the actual effort?

The relative sizing held up well conceptually across both sprints, Sprint 1's 8-point stories (Grade Project, Verify Voter Identity) clearly involved more logic and complexity than its 2-point story (Student Team Views Leaderboard), and the same pattern held in Sprint 2. Since this was a simulated sprint completed in one sitting as per the lab manual instructions, actual time-based effort couldn't be measured directly that comparison would only be meaningful once a team tracks estimates against real, day-by-day development work.

2. Was your backlog well-prioritized?

Yes, prioritization was applied correctly across both sprints. Sprint 1 contained every High-priority story - profile creation, repository validation, digital rubric grading, public voting, and anti-sybil verification ensuring the most critical, highest-risk functionality was tackled first. Sprint 2 correctly carried the remaining Medium and Low-priority stories, such as profile editing and the leaderboard views. This reflects proper Agile sequencing: build the highest-value features before the supporting ones.

3. How did your simulated sprint align with your plan?

Both sprints followed the plan exactly as intended by the lab manual, which instructs simulating a sprint by moving tasks through To Do → In Progress → Done within a few minutes. Sprint 1 (31 points) and Sprint 2 (23 points) were both planned for a 1-week duration and both reached 100% completion, matching the manual's own worked example. The burndown chart's steep drop reflects this intentional time compression, not a deviation from the plan, the sprint's *scope* and *completion* aligned fully with what was planned; only the *pacing* was compressed, which is exactly what the exercise calls for.

4. What insights did the burndown chart give about your team's capacity?

In a live, real-world sprint, this shape would normally be a useful signal, a team consistently finishing this early might be under-committing during planning and could safely take on more work next sprint. Since this lab compresses a full week into a few minutes by design, the same signal here simply confirms that both sprints were executed exactly as scoped, giving a clear, consistent burndown pattern to analyse rather than an ambiguous or partial one.
