Lab 5: Static Code Analysis

Campus Shuttle Timetable & Fleet Tracker (shuttle_system.py)

Name: Rhea Sushanth

SRN: PES1UG24CS371

Section: 5G

Git Repository:

https://github.com/rheasushanth/L5_07_campus_shuttle

Date: 30 October 2026

1. Introduction to Static Code Analysis

Static code analysis is the examination of source code without executing it, in order to find bugs, security vulnerabilities and style violations early in development. Because it runs on the code itself, it can be automated in editors, pre-commit hooks and CI pipelines, catching problems before they reach testing or production. In this lab, three industry-standard Python tools were used:

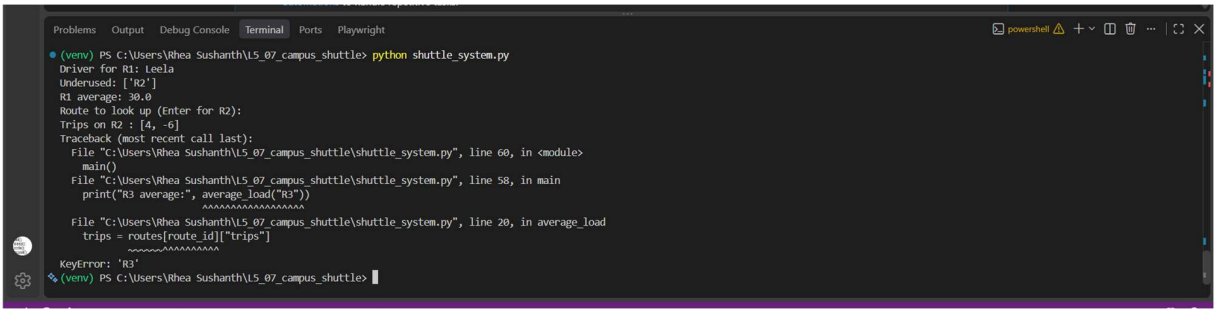

- **Pylint** – a "strict code reviewer" that checks code quality and logic: unused variables and arguments, dangerous default values, bare exceptions, naming conventions, missing docstrings and resource handling. It also gives the code an overall score out of 10.
- **Flake8** – a "grammar checker" that enforces PEP 8 style: whitespace, blank lines, line length, and simple syntax / logic errors (via pyflakes).
- **Bandit** – a "security guard" that scans for common security problems such as silently swallowed exceptions, insecure random number generators, use of eval/exec, hard-coded passwords and unsafe subprocess calls.

The program analysed is a campus shuttle tracker that logs passenger counts per trip, computes average loads, flags under-used routes and syncs the fleet data to fleet.json.

2. Issues Identified (Before Fixing)

Running the original program crashed with KeyError: 'R3' and silently accepted invalid passenger counts (-6 and "full").

2.1 Original program output

2.2 Pylint (before) – score 6.25/10

```
(venv) PS C:\Users\Rhea Sushanth\L5_07_campus_shuttle> pylint shuttle_system.py
************ Module shuttle_system

3. Issue Identification Table

#	Issue	Type	Tool / Code	Line(s)	Severity	Description	Fix Approach
1	Bare except: pass	Security / Bug	Bandit B110, Pylint W0702, Flake8 E722	29-30	Medium	Catches *every* error (even KeyboardInterrupt) and silently ignores it, hiding the R3 "full" TypeError and any divide-by-zero.	Removed the try/except; average_load now returns None for routes with no trips and underused_routes skips them. Bad data is rejected at input instead.
2	Insecure random generator	Security	Bandit B311	35	Low	random.choice is a predictable pseudo-random generator, flagged by Bandit as unsuitable for anything security-related.	Replaced with secrets.choice.
3	Mutable default argument	Bug	Pylint W0102	11	Medium	logs=[] is created once and shared by every call, so log entries pile up across unrelated calls.	Default changed to None and a new list is created inside the function.
4	Files opened without with / encoding	Bug / Resource leak	Pylint R1732, W1514	39, 42	Medium	Second open() is never closed (file handle leak); no encoding means behaviour depends on the OS.	Used with open(..., encoding="utf-8") and json.dump / json.load.
5	global statement	Design	Pylint W0603	38	Low	Rebinding the global routes inside a function makes the state hard to follow.	Updated the existing dict in place with routes.clear() + routes.update(), so no global is needed.
6	Invalid passenger data accepted	Logic bug (not flagged by tools)	—	49-50	High	-6 and "full" are stored as trip counts. "full" makes sum() crash, and -6 corrupts the R2 average.	add_trip_log validates the count (must be a non-negative int) and raises; main uses safe_log to report rejected trips.
7	Crash after route removed / unknown route	Logic bug (not flagged by tools)	—	55-58	High	R3 is deleted and then average_load("R3") raises KeyError; typing an unknown route at the prompt also crashes. Empty routes cause ZeroDivisionError.	average_load uses routes.get() and returns None; main checks choice in routes before using it; remove_route uses pop(..., None).
8	Bad function name & unused argument	Style	Pylint C0103, W0613	33	Low	assignDriver isn't snake_case and its route_id parameter is never used.	Renamed to assign_driver() and removed the unused parameter.
9	Old-style % formatting	Style	Pylint C0209	13	Low	% formatting is harder to read than an f-string.	Converted to an f-string.
10	Missing docstrings	Style	Pylint C0114, C0116	1, 11-45	Low	Module and functions have no documentation.	Added a module docstring and one per function.
11	Missing blank lines (PEP 8)	Style	Flake8 E302, E305	11-60	Low	Functions need 2 blank lines between them.	Added 2 blank lines before each top-level definition.
12	Line too long	Style	Flake8 E501	13	Low	Line is 82 chars (limit 79).	Wrapped / rewrote the line.
13	Code runs on import	Design	—	60	Low	main() runs even when the file is imported.	Wrapped in if __name__ == "__main__":.

Summary of results

Tool	Before	After
Pylint	6.25 / 10 (18 messages)	10.00 / 10
Bandit	2 issues (Low: B110, B311)	0 issues
Flake8	10 issues	0 issues

6.3 flake8_report.txt (after)
(empty – Flake8 reported 0 issues)

The "after" Bandit text above is from the final code, which has about 82 lines. If your own bandit_report.txt in the main folder shows a different line count, use your file's text instead.
Put sections 5 and 6 **after** your "4.5 Git commits" and **before** "7. Reflection", so the numbering runs 1 to 7.

7. Reflection

1. Which issues were the easiest to fix, and which were the hardest? Why?

The easiest were the Flake8 style issues (missing blank lines, a long line) and the Pylint naming / docstring messages. They are mechanical: the tool tells you the exact line and what is wrong. Swapping `random.choice` for `secrets.choice` was also a one-line change. The hardest was the bare `except: pass`. Simply naming an exception type would have silenced the tools, but the real problem was that bad data (`"full", -6`) was getting into the trip lists in the first place. Fixing it properly meant adding validation in `add_trip_log` and making `average_load` handle empty or missing routes. The `global routes` warning also needed a bit of thought, since I had to update the dict in place rather than reassign it.

2. Did the static analysis tools report any false positives? If so, describe one example.

Bandit's B311 warning on `random.choice` is close to a false positive here. Picking which driver gets a route is not a security or cryptographic task, so a predictable generator is not a real risk. I still switched to `secrets.choice` because it costs nothing and clears the report, but in a real project this could reasonably be marked `# nosec`. Pylint's missing-docstring messages are also low value on very short, self-explanatory functions. On the other side, the tools missed real bugs: none of them flagged the negative passenger count, the `"full"` string, or the `KeyError` from looking up R3 after it was removed. I only found those by running the program.

3. How would you integrate static analysis tools into your actual software development workflow?

I would run Flake8 and Pylint automatically in a pre-commit hook so style problems never reach the repository, and run all three tools (including Bandit) in a CI pipeline such as GitHub Actions on every push and pull request. The build could fail if the Pylint score drops below a threshold (e.g. 9.5) or if Bandit reports any Medium/High issue. I would also enable the linters in my editor (VS Code) so issues show up while I type, and keep a shared config file (`.pylintrc`, `.flake8`) so the whole team uses the same rules.

4. What tangible improvements did you observe in the code quality, readability, or potential robustness after applying the fixes?

The Pylint score went from 6.25 to 10.00, and Bandit and Flake8 now report zero issues. More importantly, the program no longer crashes: before, it ended with a `KeyError` for R3, and typing an unknown route also crashed it. Invalid inputs like `-6` and `"full"` are now rejected with a clear message instead of silently corrupting the averages (R2's average was being pulled down by the negative count). Files are closed properly, the log list no longer leaks between calls, and every function has a docstring and a clear name, so the code is easier to read and safer to change.
